

ScamAI ML Intern Assessment — Take-Home Project

Build Something That Fights AI Negativity

"AI is being used to steal billions, break trust, and manipulate millions. Be part of the solution."

Your Mission

At ScamAI, our cornerstone is simple: **combat AI negativity** — the growing wave of harm, fraud, manipulation, and mistrust caused by the misuse of AI.

What that looks like in practice is up to you.

Build **anything** — a tool, an app, a browser extension, a bot, a dataset, a detector, an API, a game, a campaign — as long as a reviewer can look at it and clearly say: *"this pushes back against AI being used for harm."*

There is no prescribed topic, no required stack, no template to follow. This is intentionally open. We want to see how you think.

The Only Rule

Your project must have a **clear and defensible answer** to this question:

"How does what you built make the world more resilient to AI being used negatively?"

If you can answer that convincingly in your demo video, you're in the right territory.

Deliverables

1. **Public GitHub repo** — with a README that covers what you built, why, and how to run it
 2. **Short demo video (2–4 min)** — walk us through what you made and make the case for why it combats AI negativity
-

What We're Looking For

- **Conviction** — do you genuinely believe in what you built?
- **Execution** — does it actually work?
- **Originality** — did you find an angle we haven't seen before?
- **Clarity** — can you explain the mission-fit simply and directly?

Time budget: We suggest no more than **~2 hours**. Scope to fit.

Note:

- 1) It doesn't have to be perfect, it just has to show us your process of thinking and creativity towards tackling an open-ended question.
- 2) You are allowed(and **encouraged lol** :) to use any AI assistants/tools to assist you, but we will be assessing your decision-making and other analytical skills that reflect your thinking rather than your ability to just output code.
